

Project 1-Web Page Design

Objectives

To practice HTML and CSS, and hosting using GitHub Pages and/or <http://www.render.com>.

Overview

1. The first part is defining HTML and CSS for an image we have provided.
2. The second, is to create your own page and upload it to the a hosting site using either GitHub Pages or Render [render.com](http://www.render.com).

Academic Integrity

Please make sure you read the academic integrity section of the syllabus so you understand what is permissible in our programming projects. Any case of academic dishonesty will be referred to the [University's Office of Student Conduct](#). Please don't post your code online where others can see your code.

Grading

- (50%) Summer Page (HTML/CSS)
- (50%) GitLab or Render Hosting

Code Distribution

Pull from upstream to get the starter folders!

Specifications/Requirements:

Part 1

Part # 1 (Summer Camp Page)

You will define HTML and CSS to recreate the page you see in the following image [Summer Page](#). For this page:

1. Implement the HTML code in a **index.html** file (you create).
2. The title (to be used with <title> tag) for the document will be "UMD HTML/CSS Summer Camp."
3. Implement the CSS in a **Summer.css** file (you create).
4. Do not add CSS to the HTML file at all (if you do, you will lose credit).
5. The HTML/CSS should generate a page that looks very close to the image we have provided.
6. When a user clicks on the University of MD globe, a new page/tab will open with the CS Department website (www.cs.umd.edu).
7. When users hover over the first paragraph (the one starting with "The UMD ...") the color of the text must change from brown to red.
8. Colors used by this page: black, antiquewhite, brown, white, red, and blue.
9. You can use the <hr> tag to create a horizontal rule (line).
10. The only unit you can use in the CSS file is **rem** (except for the **html** element which we have already set to be 14px). Do not use em either; only use rem. You will lose credit if you use a unit other than rem.
11. The "Campus Tour" link is <https://umd.edu/visit>
12. When you hover over the "Campus Tour" link the message "Virtual Tour" should appear (use the **title** attribute).
13. Replace the Instructor.html link you see in the image with <https://www.cs.umd.edu/people/egonzal5>
14. All your CSS for this page must appear in the **Summer.css** file.
15. You must use at least one class selector.
16. You must use at least one id selector.
17. You will lose credit if your HTML does not validate according to the VS Code HTML validation extension "W3C Web Validator by Celian Riboulet".
18. You do not need to validate your CSS although it is recommended.

Part 2

Part #2.1 (Your Own Page)

You will define HTML and CSS to define a page of a topic you choose. For this page:

1. At the top of your page, before you add your own contents, add your name, and a link to the render/github pages site you created.
2. This website should serve as a bare bones resume for you.
3. You need to add a file named index.html
4. **DO NOT post the summer page work (in the same folder) to; only your own page with the topic you chose.**
5. You can add additional HTML or CSS files.
6. You need to use the following HTML tags in your page, otherwise you will lose credit.
 - A table that relies on **thead** and **tbody** (tfoot is optional). The table should have rows with alternating colors using the css rule we described in lecture.
 - You need to use a [google font](#). The font may not be one used by lecture examples.
 - A link to a YouTube video.
 - The page background must have a picture.
 - Your CSS file (style.css) must have and use at least one CSS custom property (variable).
7. Add a favicon to your page. There are several favicon generators you can find online. One generator can be found at <https://realfavicongenerator.net/>.
8. Feel free to use any other HTML tags.
9. Validate your HTML or CSS for this work.

SUPER IMPORTANT

At the end of your index.html page, you need to add the following code that has a server-side include that will tell us when you modified the file:

```
<strong>Last Modified: </strong><!--#echo var="LAST_MODIFIED" --><br>
```

10.

If you don't have this entry, you will lose significant (if not most) of the points for this part of the project, as we will not know when you last edited the file.

Part #2.2 (Hosting Practice)

You need to either host a page on <http://www.render.com/> using <https://github.com/>. The page that should be displayed is your portfolio/resume page from part 2.1. Other tips/requirements:

- Remember that you don't have to pay anything to use render.com or github
- To deploy your page, create a VS Code folder with an index.html file (NOTICE IT CANNOT have the .html extension) with the information specified above.

Other Specifications

- You may not use any authoring tool (e.g., Dreamweaver, ChatGPT, YourCSFriendGPT, etc.) that generates the HTML/CSS/JavaScript code for you.

- You must implement this project by yourself.
- Make sure you view your code using Chrome (that is the browser we will use to grade your project).
- You can use any HTML/CSS code we have provided in lecture examples.

Part 1 and 2 Submission

- To submit your project, please put your html and css files in the folders in your gitlab repository.
- Add, commit and push to **your** origin repository online!
-
